Human neuronal calcium chan
Human neuronal calcium chan
Human mitosin gene. Purifie
Mitosin nucleic acid sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection, purification and elimination of antigen-specific
Tymphocytes - for producing cytotoxic T cells for immuno-therapy of
Cancers and viral infection
Example 2; Fig 10; 222pp; French.

Example 2; Fig 10; 222pp; French.

Control of antigen-specific lymphocytes comprises forming a complex
Control of antigen-specific lymphocytes comprises forming a complex
Control of antigen-specific lymphocytes compatibility complex (MHC) molecules,
confined antigen-specific lymphocytes. Expression of the MHC molecule in a cell
confined of antibody against the MHC molecule or by an antibody to
can specific lymphocytes. Expression of the MHC molecule or a cell
confined of antibodies against the MHC molecule or by an antibody to
can comprise the first 3 domains of the HLA-A2.1 heavy chain linked to human
confined to man a floatible linker. The method is also used to
detect and quantify tumour-specific T-cells and to generate CTC for
specific killing of tumour cells (solid tumours, leukaemia or lymphoma)
by infections.
                                                                                                                                                                                                                    14-OCT-1998 (first entry)
Chimeric HLA-A2.1/Deta-2 microglobulin coding sequence.

HIA-C gene, DNA probe and transformant cells - for immunisation of animals and monoclonal antibody development.

Claim 2; Page 1; 13pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and produ. of monoclonal antibodies specific for the HIA-C antigen. See also 01216 (same patent) and J03112486 and J03112487. sequence 1101 BP; 215 A; 335 C; 379 G; 172 T;
                                                                                                                                                                                                     HIA-C gene, DNA probe and transformant cells - for immunisation of animals and monoclonal antibody development.

by a process comprising: (a) streething agenomic DNA library using as a process comprising: (a) streething agenomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 (a) 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or CDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome. Products from the present fragments of the S. pneumoniae genome. Products from the present compositions and vaccines for S. pneumoniae. Some sead in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V5254) recorded on it, or a representative fragment or a sequence at least 958 identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391 (V52134 to V5.524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Computer readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus pneumoniae genome fragment SEQ ID NO:172.

The present invention describes a computer readable medium which has
The present invention describes a computer readable medium which has
The present invention describes a computer readable medium which has
The nucleotide sequences SEQ ID No.; it to 391 (752134 to V52524) recorded
The nucleotide sequences to a sequence at least 95% identical
To 391 (V52134 to V52524) are genomic fragments from Streptococcus
The present invention also describes an isolated nucleic acid
molecule encoding a homologue of any of the fragments of the S. pneumoniae
The present invention also describes an isolated nucleic acid
molecule encoding a homologue of any of the fragments of the S. pneumoniae
The process comprising; (a) screening a genomic DNA library using as a
probe a target sequence defined by any of the sequences in SEQ ID No: 1
That hybridise to the target sequence and isolating encoding to any produced
from an organism, amplifying nucleic acid molecules whose nucleotide
from an organism, amplifying nucleic acid molecules whose nucleotide
sequence is homologous to amplification primer the amplification and
isolating the amplified sequences. The computer readable medium can be
used in a computer-based system for identifying fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical
                                                                                                                   Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2890 G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protecting plants against pathogens with genetically transformed biological control agent - which expresses all polypeptide(s) biological control agent - which expresses all polypeptide(s) an unverse protecting by protolitin biosynthetic pathway as 16; Column 104-128; 88pp; English.

This genomic DNA sequence encodes the Soraphen gene cluster. This sequence encodes two open reading frames (ORF's), the positions of which size and encodes 5 biosynthetic modules homologous to the erythromycin genes of Saccharopolyspora erythraea. Each module contains a genes of Saccharopolyspora erythraea. Each module contains a beta-ketoacylsynthase (KS), an acyltransferase (AT), a ketoreductase (KR) and an acyl carrier protein (ACP) domain. ORF2 is immediately adjacent to ORF1 and is thought to contain 3 modules. Soraphen is a crypt page (PRS) which has antiblotic activity.

Transgenic plants containing such antipathogenic genes like those encoded in the Soraphen cluster should have enhanced resistance to
                                                                                                                      7 14-DEC-1995.

8 Pyrrolnitrin and soraphen, useful for disease control in plants pyrrolnitrin and soraphen, useful for disease control in plants
8 Claim 3; Page 140-158; 190pp; English.
9 This is the soraphen gene cluster from S. cellulosum. The gene cluster may be expressed recombinantly to produce soraphen, or expressed in a transgenic plant for disease-resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence contains a cluster of genes that encode polyketide synthases (PKSs) that are involved in the synthasis of soraphens in sorangham cellulosum. The proteins encoded by the present sequence are Sorangium cellulosum. The proteins encoded by the present sequence are Soran, Sorah, SorB and SorM. SorA and SorB contain biosynthetic modules which contain a beta-ketoacylsynthase, an acyltransferase, a ketoreductase and an acyl carrier protein domain, as well as beta-ketone processing domains. S. cellulosum soraphens are useful as a cytostatic and antimicrobial agent active against phytopathogenic fungi. Soraphen-producing transgenic plants or biological control agents can also be produced, which may reduce crop losses and nutritional deprivation for local populations in many parts of the world.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated swine hepatitis E virus - used to develop products for the diagnosis, prevention and treatment of hepatitis E virus infection in mammals, particularly humans Example 1; Fig 6A-C; 70pp; English.

This invention describes a swine hepatitis E virus (HEV) and its natural mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-JUN-1999 (first entry)

The diagnosis, prevention and treatment of hepatitis E virus for the diagnosis, prevention and treatment of hepatitis E virus for the diagnosis, prevention and treatment of hepatitis E virus for the diagnosis, particularly humans

Frample 1, Fig 7A-D; 70pp; English

Example 1, Fig 7A-D; 7app; English

Example 1, Fig 
can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-JUN-1999 (first entry)

The antigenic polypeptide encoded by this sequence, its fragments and variants can be used in a vaccine to protect against infection by a cestode parasite, particularly in ruminants. The nucleic acids (See also T17934) can be used to produce recombinant viral vaccines. The DNA (preferably this DNA sequence) can also be labelled and used as a probe to identify nucleic acids encoding a protective antigen of an Echinococcus or Taeniid parasite other than Taenia ovis. Sequence 360 BP; 98 A; 99 C; 86 G; 77 T;
                                                                                                                                      Taenia ovis antigenic polypeptide coding sequence.

New protective antigen from Taenia ovis - and related DNA vectors, transformed cells and antibodies, useful in vaccines, also for detecting homologous genes and proteins Disclosure; page 22-23; 37pp; English.

A T. ovis oncosphere lambda gill cDNA library was screened with rabbit antibodies raised against a 16 kDa protective antigen of T. ovis. The insert from a selected clone was subcloned into vector pGEX-2T and expressed as a glutathione-S-transferase fusion protein in Escherichia coli JMIOI. The DNA and predicted amino acid sequences of the T. ovis portion of the fusion protein were
                                                                                                                                                                                                                                   sequenced

**NOTE: This is a 'working draft' sequence. It currently consists of 93 contigs. The true order of the pieces

**is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

**This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (0.3-Angu-1999) Production Sequencing Facility, DOB Joint Genome Institute.

LEST (Submitted (0.3-Angu-1999) Production Sequencing Facility, DOB Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA ON Oct 31, 1999 this Sequence version replaced gi:5686476.

* NOTE: This is a "working draft, sequence. It currently tonsists of 60 contigs. The true order of the pieces and their order in this sequence record is arbitrary. Gaps between the contigs are represented as truns of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Direct Submission

Submitted (30-OTT-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. Email enquiries: humquery@sanger.ac.uk CDne requests: clonerequest@sanger.ac.uk

On Oct 29, 1999 this sequence version replaced g1:6058975.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Ems., EMBL: Sw.; SWISSPROT: Tr.; TREMBL: Wp:, WORNPEP: Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep IMPORTANT: This sequence is not the entire insert of clone 1106NLB. It may be shorter because we only sequence overlapping sections once, or the contract because we arrange for a small overlap between neighbouring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The true left end of clone 906P16 is at 142237 in this sequence. The true right end of clone d31193N1 is at 79367 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq_documentation_block:

It currently consists of 42 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   f unknown length

Protein coding regions (CDS) have been predicted with the help of computer analysis using the Genefinder program in Pombase (an ACEDB database) with additional predictions for the branch-acceptor sites supplied by the program spisplice. CAUTION: It is possible that for number of introns/exons or we may not have chosen the correct splice donor/acceptor sites. CDS are numbered using the following system eg SPBC25H2.Olc. SP (S. pombe). B (chromosome 2), c25H2 (cosmid name). Ol (first CDS), c (complementary strand). The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

IMPORTANT: This sequence MAX NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (27.74R-1998) European Schizosaccharomyces genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk applied biologiese Universiteit Leuven, Faculty of Agricultural and Applied Biological Sciences, Laboratory of Gene Technology, Kardinaal Mercierlaan 92 Blok F, B-3001 Leuven, Belgium 2 (bases 18652 to 34051)

overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid c14C8 is overlapped at the 3' end by c15C4. Details of yeast sequencing at the Sanger Centre are available on the World Wide Web. (URL, http://www.sanger.ac.uk/Projects/S_pombe/) buring 1995 to 1996 about 66% of S. pombe chromosome 1 was sequenced by the Sanger Centre. The sequencing of the S. pombe genome is now being continued with funding from The European Commission. Fourteen European sequencing laboratories, including the Sanger Centre, are participating in the project.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4172. 5452
